Summary

Senior Research Software Engineer who spearheaded efforts in **RL based alignment (Post-Training), LLM Safety, model pruning, distillation, AutoML** and with strong benchmark performance and production impact. Published in top-tier venues including **ACL, NeurIPS, ICML, ICLR and Nature Communications**.

Experience

Senior Research Software Engineer, IBM Research Feb 2014 – Present

Post-Training and LLM Safety

- Developed the **Granite Guardian** guardrail models by post-training the Granite family to detect harms such as toxicity, bias, jailbreaking and hallucinations.
- These models topped the **GuardBench** leaderboard, ranked third on **LLM Aggrefact** and are currently a core part of IBM's Trustworthy AI client offerings.
- Led the efforts to prune **Granite Guardian 3.2 8B** model to **5B** with minimal drop in performance (<2%) across all the benchmarks and devised a novel confidence based distillation algorithm to recover the performance.
- Improved the performance of **Qwen3 8B** and **DS-R1-Distill-LLaMA 8B** models on safety benchmarks by 12% through post-training with safety data using **GRPO** and using granite 3.2 5B as a reward model.
- Contributed novel contrastive explainability algorithms for deep learning and machine learning classifiers to IBM's explainability toolkit while supporting technical delivery for various client engagements.

Efficient LLMs

- **Efficient inference:** Led the development of novel algorithms for model, activation and KV cache pruning that reduced inference latency up to 9% and memory usage up to 17%.
- Designed adaptive inference budgeting methods to estimate reasoning ("thinking") budgets for LLMs, improving cost-efficiency.
- **Efficient model training:** Devised algorithms for training data subset selection, long context understanding and knowledge distillation that accelerated the training speed by up to 10 times.

AutoML

- Architected a modular **Neural Architecture Search (NAS)** framework that supported multiple search algorithms and resilient state recovery, which was later released as an IBM product for image and text modalities.
- Led two client engagements to train bespoke models for legal domain (text) and electronics domain (images).
- Improved search efficiency by 100 times using a meta-learning-based early stopping mechanism to filter out low-performing candidates.
- Developed a meta-learning algorithm to automate feature engineering for tabular datasets.

Honors & Recognition

IBM Outstanding Technical Achievement Award (3x): Recognized for technical contributions to the **Granite-Guardian** guardrail models, the **AI explainability** toolkit, and the **NAS and AutoAI** products.

Software Developer Intern, Yahoo Inc. Jun 2013 – Aug 2013
Software Developer, ThoughtWorks Technologies Ltd, India Aug 2008 – Jun 2012

Select Talks

- Invited talk at Women in Data Science Conference 2025: "Challenges in Long Context LLMs".
- Invited talk at Open Data Science Conference East 2023: "Introduction to AutoML: Hyperparameter Optimization and Neural Architecture Search".
- Tutorial at AAAI 2021: "Efficient Neural Architecture Search".
- Talk at ICMR 2020: "Automation of Deep Learning-Theory and Practice".
- Talk at CVPR 2020: "Transfer Learning for Neural Architecture Search".

Education

M.S. in Computer Science (NLP & ML) | Columbia University Sep 2012 – Dec 2013
B.Tech in Information Technology | PSG College Of Technology, India Aug 2004 – May 2008

Technical Skills

Core Expertise: Alignment, Post-Training, RL, Model Pruning, Distillation, AutoML, Distributed Training
Deep Learning Frameworks: Pytorch, Deepspeed, Accelerate, FSDP, Ray, verl, TRL, VLLM
